

Figure 6

Master Intake Tower 1

- Tower 1 has two master intake ports. These ports also have a piston intake relief valve in place.
- It is important to understand that not only do you have to open the piston intake, but also open the electronic valve located on the pump panel. (see figure 7)
- The master intake in Tower 1 is a slow open and close valve, the correct procedure is to bleed off the air from the piston intake relief valve, open the piston intake, then open the master intake at the pump panel.
- Tower 1 is the only NFD pump that has electronic valves.
